## Answer 5 of the following 6 questions

## Physical Constants

$$
\begin{aligned}
& \sigma=5.6705 \times 10^{-8} \mathrm{~W} \cdot \mathrm{~m}^{-2} \cdot \mathrm{~K}^{-4} \\
& R=8.3145 \mathrm{~J} /(\mathrm{K} \cdot \mathrm{~mol}) \\
& N_{A}=6.0221 \times 10^{23} \\
& k_{B}=1.3807 \times 10^{-23} \mathrm{~J} / \mathrm{K} \\
& 1 \mathrm{eV}=1.6022 \times 10^{-19} \mathrm{~J} \\
& 1 \mathrm{~atm}=1.0133 \times 10^{5} \mathrm{~Pa}
\end{aligned}
$$

## Properties of $\mathrm{H}_{2} \mathrm{O}$

$$
\begin{aligned}
& L_{V}=2256 \mathrm{~J} / \mathrm{g} \\
& c_{w}=4.19 \mathrm{~J} /(\mathrm{g} \cdot \mathrm{~K}) \\
& L_{f}=333 \mathrm{~J} / \mathrm{g} \\
& c_{i}=2.22 \mathrm{~J} /(\mathrm{g} \cdot \mathrm{~K}) \\
& \rho_{w}=1000 \mathrm{~kg} / \mathrm{m}^{3}
\end{aligned}
$$

1. In an insulated container, 250 g of water at $35^{\circ} \mathrm{C}$ is mixed with 75 g of ice at $-20^{\circ} \mathrm{C}$. The final state consists of $100 \%$ liquid water. What will be the equilibrium temperature of this system?
2. Consider the following cycle starting with $1 \mathrm{~m}^{3}$ of a diatomic ideal gas at a pressure of 0.5 atm and a temperature of 300 K .
(a) The gas is adiabatically compressed until the temperature reaches 400 K .
(b) With the volume held constant, the temperature is increased to 450 K .
(c) The gas is then isothermally expanded until the pressure reaches 0.5 atm .
(d) In a constant-pressure (a.k.a., isobaric) process, the volume is returned to $1 \mathrm{~m}^{3}$.

On the below graph, accurately plot and label each leg of this cycle. This will require calculating various $p V T$ values at the end of some cycles. Fill in the below table giving the sign $(+,-, 0)$ of the quantity for each leg of the cycle.

| path: | a | b | c | d |
| :---: | :---: | :---: | :---: | :---: |
| $\Delta T$ |  |  |  |  |
| $\Delta E_{\text {int }}$ |  |  |  |  |
| $Q$ |  |  |  |  |
| $W$ |  |  |  |  |
| $\Delta S$ |  |  |  |  |

3. A selection of rows from a run of StatMech with $N_{A}=200$ (atoms), $N_{B}=50$, and total energy $U=2000 \varepsilon$ can be found as the final page of this exam. This Einstein solid has $\varepsilon=.005 \mathrm{eV}$.
(a) Of the rows shown: (i) the entropy of $A$ is largest in which row? (ii) the entropy of $B$ is largest in which row? (iii) the combined entropy of $A$ and $B$ together is largest in which row? Including rows not recorded here, where (approximately) would you expect the combined entropy of $A$ and $B$ together to be largest? Why?
(b) Approximate $\frac{\partial S}{\partial U}$ as a (small) finite difference $\frac{\Delta S}{\Delta U}$. Use this result to find an equation for the temperature of this Einstein solid. Simplify your result using the properties of logarithms. Calculate $T_{A}$ (the temperature of system $A$ ) using $\Delta U=1 \varepsilon$ for $U_{A}=100 \varepsilon$, $U_{A}=1600 \varepsilon, U_{A}=2000 \varepsilon$. Calculate $T_{B}$ (the temperature of system $B$ ) using $\Delta U=1 \varepsilon$ for $U_{B}=1900 \varepsilon, U_{B}=400 \varepsilon$.
4. A particular atom has three states: a ground state (at energy $E_{0}=-1 \mathrm{eV}$ ), and two excited states (at energies $E_{1}=-.995 \mathrm{eV}, E_{2}=-.994 \mathrm{eV}$ ). What is the probability that the atom is in the state $E_{1}(\mathrm{a})$ if the temperature is 100 K ? (b) if the temperature is $10^{9} \mathrm{~K}$ ? What is the relative probability the atom is in the state $E_{2}$ compared to state $E_{1}$ (c) if the temperature is 100 K ? (d) if the temperature is $10^{9} \mathrm{~K}$ ?. Would your answer to these questions change if the energies instead were: $E_{0}=0 \mathrm{eV}, E_{1}=.005 \mathrm{eV}, E_{2}=.006 \mathrm{eV} ?$
5. Define five of the following terms:
(a) carnot cycle
(b) degree of freedom
(c) entropy
(d) equipartition theorem
(e) heat
(f) multiplicity
(g) second law of thermodynamics
(h) temperature
6. The following problem is based on "steam tables"-tables of $V, T, E_{\text {int }}, S$ etc. which substitute for the simple equations like $p V=n R T, \Delta S=n C_{p} \ln \left(T_{f} / T_{i}\right)$ etc. that apply only to the mythical ideal gas. Again steam is a non-ideal gas; you must use the tabulated $V, T, E_{\text {int }}, S$ etc. not formulas based on $p V=n R T$.

- 1 kg of liquid water (1a) at a temperature of $311^{\circ} \mathrm{C}$ and pressure of 10 MPa has been pumped into a boiler. In an isobaric process the water is totally evaporated (point 1b) and then the resulting vapor is heated to $1200^{\circ} \mathrm{C}$ (point 2).
- The high pressure steam is piped to a turbine where it expands adiabatically to pressure of 0.01 MPa in the process of doing work (point 3)
- In an isobaric process, the steam is cooled until it starts to condense (point 4a) and finally all the vapor is converted to liquid (point 4 b ).
- A pump is then used to re-inject this low pressure, low temperature water back into the boiler. Approximate this process as a straight-line $p V$ process.

This cycle is displayed below on a $\log -\log T-V$ diagram. The region below the dotted curve consists of a mixed phase: part liquid and part vapor. In an isobaric boiling process the system moves horizontally from the left boundary to the right as $100 \%$ liquid is converted to a much larger volume of $100 \%$ vapor at a constant temperature. The following table reports state variables at the labeled points.

(a) Find the heat required to evaporate the water at a pressure of 10 MPa (i.e., the process $1 \mathrm{a} \rightarrow 1 \mathrm{~b}$ ) from $\Delta S$.
(b) Find the work done in the turbine during $2 \rightarrow 3$.
(c) Find the heat released when the vapor is condensed to liquid at a pressure of 0.01 MPa (i.e., the process $4 \mathrm{a} \rightarrow 4 \mathrm{~b}$ ) from the first law of thermodynamics.
(d) Find the heat added in the straightline expansion $4 b \rightarrow 1$ ?

Total number of microstates $=3.0004 \mathrm{E}+697$; Total system energy $=2000$ units
